Introduction

Purpose

The purpose of this document is to provide a reference at any time for resources working on the Application and Technical Architecture of the <Project Name>. This document is used to circulate for feedback and support of the entire project team to proposed conceptual approaches to resolving architecture requirements.

This document is also the source for current application and technical architecture information for project team members in processes with a dependency on the high level architecture model for <Company Short Name>'s future information systems.

This document describes:

- high level business operations requirements for the future architecture
- data center operations requirements for the future architecture
- high level conceptual view of each of the integrated application and technical architecture models for the business
- conceptual approaches to resolving architecture requirements as defined in the Architecture Requirements and Strategy document
- advantages and disadvantages of each conceptual architecture model
- preferred architecture model out of the candidate architectures

The Conceptual Architecture is a critical milestone in the development of security, reporting, application, database and application server, and network architectures.

Sources

This Conceptual Architecture document was prepared with input from the following sources:

- Project Management Plan [PJM.CR.010, initial complete], produced in task PJM.CR.030, for the <Project Name>
- Architecture Requirements and Strategy (TA.010) for the <Project Name>

Business Operations

<Company Long Name> is a:

Key Business Organizations and Functions

Business Organization	Site	Business Functions	Business Organizations Served	Comments

The following diagram represents the geographical distribution of business operations:

Financial Structure

Chart of Accounts

Revenue Recognition

Corporate Finance

Subledgers and Local General Ledgers

Consolidation Approach

Intercompany Settlements

Major Business Processes

The following are the key business processes that will significantly affect the application architecture:

- Sales and Market Management
- Order Fulfillment
- Post Sales Service
- Procurement
- Operations
- Materials Management
- Planning and Forecasting
- Product Development
- Financial Management
- Human Resource Management
- Enterprise Management
- Quality Management
- Information Technology Management

Sales and Market Management

Order Fulfillment

Data Center and Hosting Facility Operations

Data centers and hosting facilities which support <Company Short Name>'s information needs are located in the following cities and countries:

Location	Serves Business Organizations	Company Owned or Managed
Istanbul, Turkey	All in Europe, Middle East	Hosted Facility by Inkora Facilities Plc. (Istanbul, Turkey)

The following diagram represents the geographical distribution of the data centers:

Data Center/Hosting Facility - <Data Center Name/Location>

Current Operations

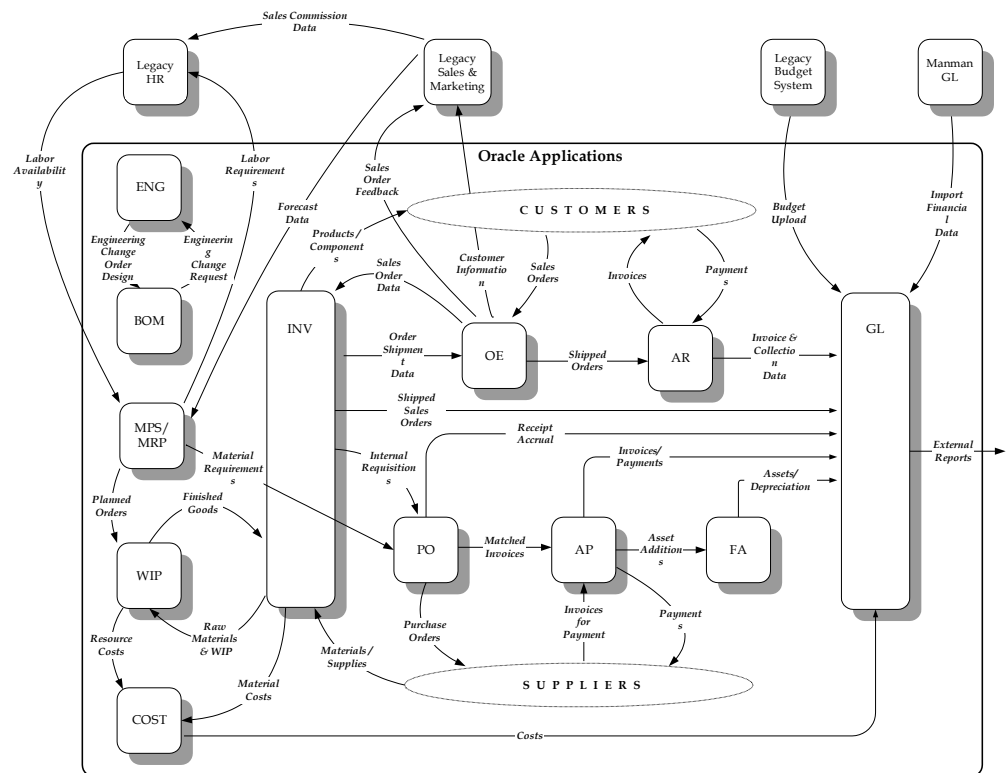

Planned Operations

Business Information Model

Information Flows

The information model describes the information flows that result from the key business processes executed in the corporation. The information flows documented here are associated with the following business processes:

- <Process Name>
- <Process Name>

Information Access

The information model describes the access to information that business units need in order to execute the business process steps in which they provide services without compromising the integrity and security of the enterprise information as a whole.

Information access is concerned with:

- information (data) partitioning to provide security and maintain integrity
- information (data) aggregation, consolidation, and summation to provide appropriate reporting views of the state of the business

Information Security

Ownership of Reference (Master) Data Objects

The following sets of (reference) master data objects are important for the business:

- Chart of Accounts
- Part Master
- Vendor Master
- Customer Master

The security and ownership policies and requirements relevant to the creation, change, or deletion of these master data objects are:

- <Security and Ownership Policies>

Information Aggregation, Consolidation, and Summation

Key Applications

This section describes the major or key applications that will be part of the future architecture.

Existing Applications Retained

The following key applications will be retained in the future architecture:

Application - <Application Name>

Replacement Applications

The following key replacement applications will be added in the future architecture:

Application - <Replacement Application Name>

Conceptual Architecture

Following is a summary of the architecture conceptual approaches to requirements defined in the Architecture Requirements and Strategy (TA.010).

Information Systems Organization

Application Deployment

Applications Architecture

User Desktop and User Interfaces

Foreign Currency and National Language Support

Data and System Security

Reporting Systems

Business Intelligence Systems

Strategic Enterprise Management (SEM) Systems

Workflow Automation

eCommerce and Internet Based Functions

Authentication Services

Telephony/Call Center Automation Systems

System Availability

Technical Architecture and Enabling Technology

Platform and Networks

Mobile Computing Support

Specialized Printing Systems

Custom Development

Interface Requirements

Integration with Other Information Systems

Approximate System Capacity

Analysis of Architecture Model

Business Advantages

The perceived advantages of this conceptual architecture option are:

-
-
-

Business Disadvantages

The perceived disadvantages of this conceptual architecture are:

-
-
-

Major Custom Extensions or Modifications Needed

To support this conceptual architecture, the following custom extensions or modifications are likely to be needed:

-
-
-

Risks

-
-
-

Project Environment Architecture

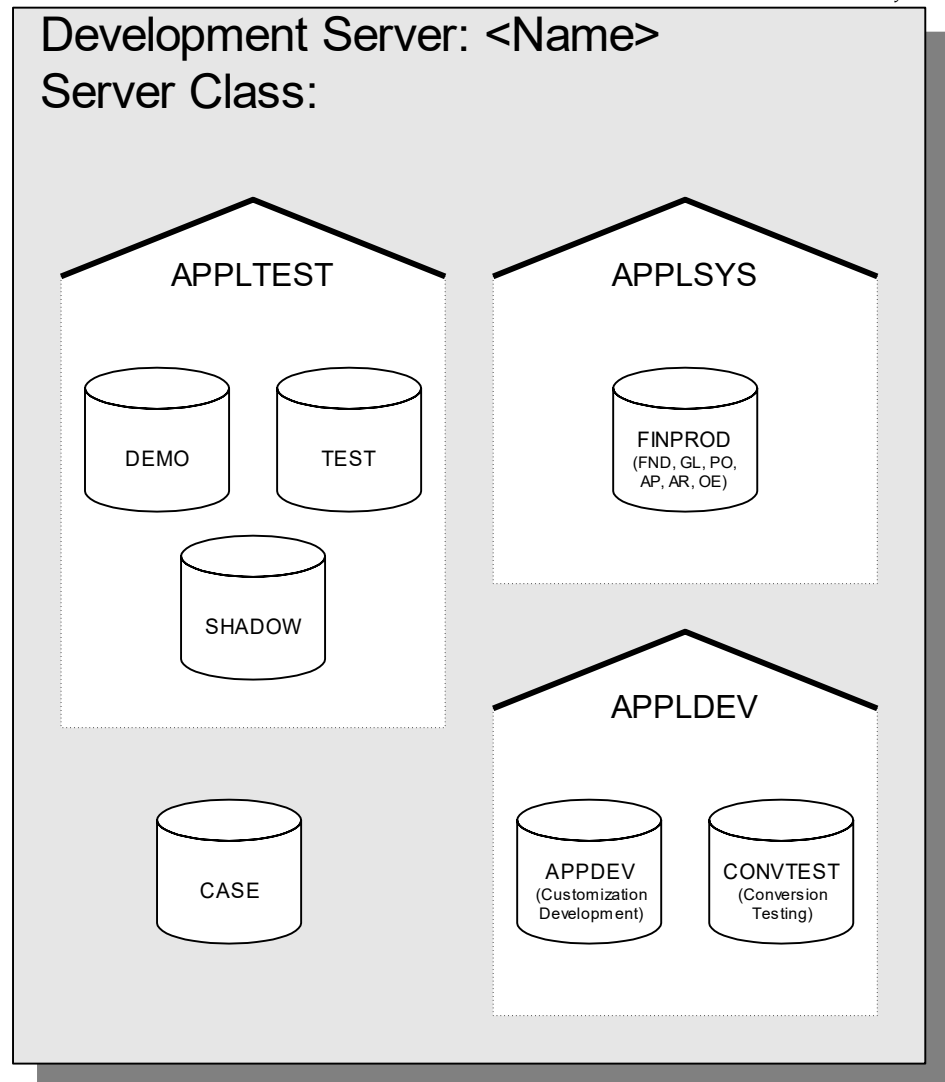

This section describes the architecture for the <Project Name> project environments.

<Project Name> will initially use a single series of servers for training, mapping, and development environments. The specific Oracle Applications environments required are:

- Seed Data
- Demo
- Development
- Test
- Production

Server Environments

This diagram illustrates the database environments installed on the project server. Boxes that resemble buildings with a roof represent an application environment — shared executable code and environment variables that identify application directories. Multiple databases may share the same environment for executables, concurrent log and output files, and so on. The database names correlate to the database instance names (ORACLE_SID).

Application Extensions and Modifications

Server Capacity Requirements

Server Processing Capacity

Server Disk Capacity

Preliminary server sizing has been performed for the project servers using the Oracle Applications Sizing Spreadsheet. The results are summarized below with additional requirements for operating system and software tools. Note that these are servers to support the development of the production environments. The production environments are sized elsewhere.

The forms server and the database server are segregated for each environment. Modified source code and application setup data will affect the purity of environments unless segregated.

Component	Con-current Processing Server (MB)	Admin Server (MB)	TRAIN Forms Server (MB)	MAP Forms Server (MB)	DEV Forms Server (MB)	TRAIN Database Server (MB)	MAP Database Server (MB)	DEV Database Server (MB)
