Introduction

Purpose

The purpose of this document is to help the development, validation and production of the actual human performance support materials. These are tailored to the targeted roles, with the measurement materials evaluating the effectiveness of the human performance support materials. The performance materials are deployed to support the performance of users in their new role, as defined through the new procedures. The requirements cover the relevant areas from the five performance areas described below:

Performance Area	Human Performance Support Systems (HPSS)
Work flows, job structure and organizational structure , to include job descriptions and possible reorganization of departments and business units	Actual and optimal content and context of jobs and departments impacted by the new or changed work processes resulting from the new technology implementation
Job Performance , to include new competency models, productivity expectations and other performance metrics, human resource allocations	For each job/role group, competencies and productivity required given the new or changed work processes, human resource allocation, gap between actual and optimal job performance
Job evaluation and classification , to include grade levels, classifications, compensation ranges	Structure of content and optimal job classification systems, as well as compensable factors, given the new or changed work processes
Performance support practices, procedures, tools, systems to interview, select, appraise performance, set performance goals, provide feedback, plan career development, reward and recognize	Content and scope of existing performance support practices, tools and systems and requirements to support new performance expectations
Job person matching : new skills profiles, learning per role, succession planning, etc.	Competencies of current job incumbents, supervisors, re-skilling requirements and succession plans

Overview

This document includes the following components:

Component	Description
Introduction	Highlights the target roles around which new or updated performance support systems are required
Current Performance Management Context	Guides the analysis of current performance support systems
New Performance Support Systems Requirements	Identifies the human performance support systems requirements for the target roles and the approach to meet those requirements
Human Performance Support Systems (HPSS) Recommendations	Lists the recommendations for the development of the new human performance support systems, the required materials, the revisions to the Human Resource Information System (HRIS) and the roll out
User Support Requirements	Guides the set up of the technical help provided to users
Work flows, job structure and organizational structure	Includes new job descriptions, new organizational chart
Job Performance	Includes new competency models, productivity expectations and other performance metrics, human resource allocations
Job evaluation and classification	Includes grade levels, classifications, compensation ranges
Performance support practices, procedures, tools, systems	Includes deliverables to guide managers when they interview, select, appraise performance, set performance goals, provide feedback, plan career development, reward and recognize

Component	Description
Job person matching	Includes new skills profiles, succession plan (Note: The learning plan is included in another deliverable, Learning Plan (AP.140))
Human Performance Support Systems Measurements	Includes materials as determined by the measurement methods recommended in the Human Performance Support Systems strategy
Human Performance Support Systems Roll Out Plan	Lists action items recommended for a successful roll out of the new Human Performance Support Systems
Human Performance Support Systems Learning Materials	Includes the materials for managers to learn how to administer the new human performance management tools
Appendix A	Location Information Spreadsheet (Embedded Object) Template
Appendix B	Job Task Analysis Questions
Appendix C	Organization's Policies and Procedures Impacted by Oracle Applications

Current Performance Management Context

List of Roles Impacted

The following are the roles impacted by the new processes and procedures (organized by business unit/department where the role is played and the related procedures that defines how to play the role):

Business Process:

<Operations (Manufacturing and Assembly)>

<Planning and Forecasting>

<Procurement>

<Financial Management>

<Post-Sales Service>

<New Product Development>

<Order Fulfillment>

<Market Management>

<Human Resource Management>

<Management Information and Decision Support>

<Information Technology Management>

Business Unit/Department	Procedure	Role	Comments

Change Context

To make sure the human performance support systems strategy is consistent with the business drivers and overall corporate strategy the project supports, it is important to understand the human resource and performance management context. This clarifies the organization's thinking into the human resource and performance management direction and implications associated with change. These insights provide the basis for deriving the performance support objectives for the technology-induced change effort.

Use the following checklist for the business motivation associated with the technology induced change.

Business Motivation	Questions
When upgrading operations	What are the new expectations for organizational performance? What experience does the organization have in upgrading operations, for example, moving from mainframe to client/server?
When expanding into new areas of business or service	Are employees given an opportunity to learn the new business, or are individuals hired with learning and experience in the new business? How is it determined whether performers and managers have the skills and abilities they need?

Business Motivation	Questions
When downsizing	Is a fast-track program maintained for managers with high potential, if the organization is flattened and advancement opportunities reduced? Is the organization continuing to hire? How is learning refocused or adapted to the change(s)? Do employees get help to find positions in other firms? Are employees offered opportunities for jobs with the organization in other locations? Are relocation expenses refunded? What is done to build the survivors' confidence in the organization?
When new skills are required	Are existing employees being laid-off and new ones hired? Are current employees selected for reskilling and redeployment?
When there is a merger	Have redundant operations been identified and eliminated? How are employees in the merged companies made to develop allegiance and loyalty to the new organization?
When there is an acquisition?	Is the acquisition more like a merger? In other words, are decisions shared by the acquiring and acquired companies? Is the acquired firm encouraged to operate autonomously, or is it integrated with the parent firm? Are human resources policies similar/different in both organizations?

Current Performance Support Systems

Listed below are the elements of performance support systems currently available. Their inventory is the first step to determine the gap between current and future requirements.

Performance Area	Currently available	Reference
Work flows, job structure, organizational structure current job descriptions and work flows, and an estimate of their validity job and departmental organization recent reorganizations that might relate to the current change effort		Policies and procedures manuals Orientation handbooks Learning manuals Organizational chart Existing job descriptions Equipment specifications Union contracts Business Process Reengineering (BPR) documentation
Job Performance competency models, their availability and use existing methods/processes for determining performance behaviors existing methods for determining productivity expectations and resource allocation productivity measurement tools		Past performance review Current productivity metrics Management handbook Budgeting procedure
Job Evaluation and Classification current grade levels current job classifications and corresponding content compensation ranges		Existing job descriptions Human Resource policies and procedures (compensation, etc.,) Union contracts ...

Performance Area	Currently available	Reference

Job-Person Matching current skills requirements and competency profiles current learning plans and offerings succession planning programs		Learning manuals Learning records Past performance reviews ...

New Performance Support Systems Requirements

Assessing the Relevancy of Current Human Performance Support Systems (HPSS)

Work Flows, Job Structure and Organizational Structure

The following questions guided the discussion of requirements for work flows, job structure and organizational structure:

- Do the existing jobs cover all the tasks required in the change effort?
- Are job tasks grouped in the most efficient ways? In ways that support the objectives of the change effort
- Do job structures require that performers
 - ◊ use multiple skills (skill variety)
 - ◊ complete a whole piece of work, that is, produce a visible outcome (task identity)
 - ◊ perform tasks that have an impact (task significance)
 - ◊ receive information at the point of performance (feedback)
 - ◊ determine how to carry out their jobs (autonomy)
 - ◊ cooperate with others (teamwork)
- Are work flows and departments/business units organized in the most efficient ways? In ways that support the objectives of the change effort?
- Are there unnecessary overlaps in responsibility for tasks?
- Are variances (changes in the state of job outputs) controlled close to the point of origin?
- Is control of variances defined in the job structures?
- Is there rotation of responsibilities and work content among performers?
- Do departmental boundaries reflect the natural breaks in the new or changed work processes?
- Do technology (complexity), territory (distance), and time (24 hour processes, etc.) impose limitations on work as it is currently organized?
- Is there interdependence among departments for needed resources?
- Are there too many participants in work flows to promote interaction/cooperation (>14-15 performers)?
- Do performers have equal access to equipment, etc.?

Job Performance

The following questions guided the discussion of requirements for job performance:

- Do existing competency models fit the job descriptions required by the new or changed work processes?
- Were competencies identified in the assessment that are not reflected in the competency models drafted in the New Performance Specifications for each Job Group?
- Do existing productivity metrics describe the outputs of the new work processes?
- Do existing productivity metrics allow for diagnosis and mid-stream corrections? Are there lagging (for example, net profit) and leading (for example, lead times, quality) indicators?
- Do existing productivity metrics measure development of competence and potential?
- Will existing productivity metrics provide information that is relevant to the objectives of the new technology implementation?
- Are the existing metrics counterproductive to the objectives of the new technology implementation?
- Are there hidden culture-driven metrics that may impair world-class performance?
- Does the existing process for setting productivity metrics involve both strategic alignment and bottom-up input?
- Are existing productivity metrics
 - ◊ used to control operations and improve process
 - ◊ produced regularly, not simply on request
 - ◊ believed and understood
 - ◊ described at the most significant level of detail/in the most significant cuts
 - ◊ complete enough to provide a whole picture
 - ◊ accompanied by plans for periodic updating
 - ◊ reported?
- Is productivity measured at the right level of aggregation (individual, team, department, organization)? At multiple levels of aggregation?
- Do productivity metrics include customer data?
- Are there multiple measures of productivity (for example, quality, delivery, time, cost)?
- Are human resource allocation data and models appropriate for the new or changed work processes?

Job Evaluation and Classification

The following questions guided the discussion of requirements for job evaluation and classification:

- Will existing job classifications or grade levels match the new or changed job descriptions?

- Does compensation need to be reevaluated to reflect any changes in job descriptions?
- Is existing job compensation internally and externally equitable?
- Will compensation need to be adjusted for different standards of living? (Are compensation levels to be centralized or decentralized?)
- Does the number of classifications/grade levels (level of bureaucratization) reflect the objectives for the new technology implementation?
- Is the job content comparable for jobs within the same job classifications or grade levels?
- Does the existing method of job evaluation (factor comparison, points rating, person-to-person comparison, etc.) determine the relative worth of a job in ways that reflect the objectives of the new technology implementation?
- Are the relative weights for the factors or points used in job evaluation aligned with the values and objectives of the new technology implementation (for example, educational level more important than experience)?
- What are the behavioral consequences for the existing method of job evaluation (for example, increased competition in the case of person-to-person comparison)?
- Is the existing method of job evaluation perceived as fair?
- Are all legal implications for compensation and job evaluation understood and addressed?

Performance Support, Practices, Tools and Systems

The following questions guided the discussion of requirements for performance support practices, tools, and systems:

- Do the existing performance support tools (for selection, performance management, etc.) reflect the new job and organizational structures, competency models, productivity metrics, etc.? Do they need to be maintained, revised, discarded?
- Do new performance support procedures, tools, and systems need to be added?
- Do the performance support practices, tools, and system link performance to the new or changed strategic goals and objectives?
- Is managers' current learning in performance support appropriate for the new performance support procedures, tools and systems?

Performance Review:

- Does the content of performance reviews fit the behavioral objectives of the new or changed work processes?
- Is there a mechanism for frequent feedback on performance?
- Is there a participative process for establishing performance objectives and goals?
- Does the performance review process focus on both accomplishments and areas to be developed?
- Do employees have a means for questioning performance reviews?

Promotion/Transfer/Career Development:

- What career development options are available? Are they communicated?
- Does the content of the career development options align with the new or changed development needs, given the new competencies required and career paths available?
- Do the career development options encourage experience and exploration outside the job incumbent's current work content?
- Is career development rewarded? Funded?
- Do career development options make use of outside resources available to the organization?
- Are there programs for external as well as internal Human Resource planning (for example, sponsorship of relevant community university programs to promote the development of the job candidate pool)?
- How is career development linked to the Human Resource Information System (HRIS)?
- How are career development options evaluated?

Rewards and Recognition:

- Do the existing rewards and recognition practices support behaviors that align with the objectives of the change effort? Do they need to reward maintenance or improvement? Potential or actual performance? Behaviors or results?
- Are rewards and recognition incentives based on the correct level of aggregation (individual, team, department, organization), given the new or changed work processes?
- Do/will all target job groups have the materials, equipment, working conditions, etc. needed to confirm that performance-based incentives are fair?
- Are rewards and recognition incentives made at the appropriate intervals? Are there short-term and long-term awards that align with strategic goals?
- Is the incentive program cost-effective?
- Is the incentive program perceived as competitive and desirable to job incumbents?

Recruitment, Selection, Termination

- Will recruitment and selection procedures reach and attract the right job candidates, given the new or changed work processes?
- Is recruitment both an internal and an external process?
- Is there a formal termination process? Does it reflect legal considerations?
- Is the termination process linked to the performance review process?
- Does the basis (bases) for termination reflect the objectives of the new technology implementation?

Job Person Matching

The following questions guided the discussion of requirements for job person matching:

- What options exist for succession planning and at what levels?
How are they linked to career development? To the Human Resource Information System (HRIS)?
- Is succession planning competency-based?
- Are all the necessary skills for the new or changed work processes covered in the target job groups? By the relevant job groups?
- Do existing learning options cover all the skills gaps?
- Do incumbent skills sets map efficiently to their existing or changed job responsibilities?
- Do existing learning options meet the logistical requirements and preferred learning styles of the target job groups?

Listing of Performance Support Needs

Based on the findings from the current human resource and performance management context and the assessment of its relevancy to the new performance environment, we have identified the following list of performance support needs.

Findings	Performance Support Needs
Work Flows, Job Structure and Organizational Structure	
	Example: The following jobs/roles need to be realigned, the following jobs/roles remain as they are, the following jobs/roles need to be created or designed, the following jobs/roles will go away, the following departments need to be merged or reconfigured, etc.
job tasks/responsibilities job interdependencies work flow (inputs/outputs) reporting relationships customers and suppliers machines, tools, equipment, work aids (MTEWA) used scope of authority autonomy and process control (Total Quality Management - TQM) decision making process organizational layers/hierarchy business processes department boundaries redundancies inefficiencies working conditions teams work procedures	
Job Performance	
	For example, for this role (or group of role), the following competencies need to be added, reinforced, or removed for each role, the following performance expectations need to be augmented, reinforced, the following resource allocation will be...

Findings	Performance Support Needs
consequences of work behaviors performance criteria productivity metrics algorithms, consistent behavior patterns of superior performers behaviors that add value, given the objectives of the technology-induced change effort customer and supplier needs/satisfaction (to guide customer-focused behaviors) human resource allocation	
Job Evaluation and Classification	
	For example, the following classification system needs to be changed to realign compensation
task attributes (importance, variety, difficulty) current job classifications grade levels rating factors union guidelines information relevant to criteria for standard job classifications (for example, government codes) scope of responsibility competencies required degree of control supervisor's style compensation ranges compensation benchmark in industry and market raises	
Performance Support Practices, Tools and Systems	
	For example, the following tools, procedures and systems are still adequate, the following need to be changed or removed, the following need to be designed or added, etc.
goal setting/performance planning hiring promotion performance feedback recruitment selection learning termination staffing career development rewards and recognition performance review policies (ethics, issue resolution, grievance, etc.)	
Job-Person Matching	
	For example, the following learning events are recommended, for these future role incumbents, the following learning programs need to be developed, the following new skills need to be acquired, the following succession plans need to be redesigned, etc.
knowledge, education level skills aptitudes orientation (attitude, preferences, etc.) learning needs succession planning	

Prioritized Job/Role and Performance Support Needs

Jobs/roles whose performance support needs will form the highest priorities in the approaches are those who have a high impact on the success of the change effort and whose current performance support infrastructure requires the most development to reach its optimal state. The next priorities are those jobs/roles whose impact is high, but whose current performance support infrastructure requires less development. Jobs/roles whose impact is medium become priorities after all job groups whose impact is high have been considered, regardless of the relative weight of their performance support gaps.

We prioritized performance support needs for each priority job/role by considering both the value they add to achieving the objectives of the technology-induced change effort, as well as the extent of their gap between existing and optimal states. The highest priorities are those that add the most to the achievement of the objectives and who also need the most work. The value they bring to the change effort takes precedence over the amount of work needing to be done to optimize them.

The following jobs/roles have the highest priorities and the support needs have the highest impact on the success of the implementation:

Priority Roles	Priority Support Needs

Objectives of New Human Performance Support Systems

The objectives of the new performance support processes are:

- Enhance employee commitment to the new organizational objectives and human resource processes.
- Explain new (organizational) strategies. Employees must understand the discrepancy between their current behaviors and the consequences of these behaviors and new expectations.
- Personalize the strategies.
- Implement Human Resource programs that are consistent with the new organizational strategies and performance support systems.
- Enhance personal accountability.

These objectives are consistent with the following needs of our users/performers:

- A clear sense of direction.
- Opportunity to participate in goals and standards for performance.

- Timely, honest, meaningful feedback (both what is effective and what can be improved) as they do their work.
- Immediate, meaningful, sincere reinforcement for their efforts.
- Coaching and assistance on ways to learn and improve.
- Treatment that involves fairness, sincerity, respect.
- Opportunity to understand and possibly influence decisions that affect them.

Specific Objectives per New Performance Process

The following documents specific objectives per new performance process:

Performance Process	Objectives
Work Flows, Job Structure, Organizational Structure	
Work flows/team	Designing the flow and organization of work may involve some or all of the following objectives: Align the work flow to optimize the new or changed work processes. Improve response time and quality by enabling control of the variances in the process where they occur. Organize teams where performance and output would benefit. Facilitate career development by providing job incumbents with opportunities to develop more skills, through job rotation and different assignments. Increase employee identification with the end product or service by designing jobs that involve complete processes and meaningful tasks. Enlarge (provide more authority) and enrich (provide more variety of tasks) jobs. Reduce the number of process steps, and thus length of the process, to speed time to completion/time to market. Increase the competencies of employees by creating less rigid job content and broadening opportunities to share responsibilities and tasks.
Job structure	Accurate, up-to-date job descriptions that describe information relevant to the objectives of the change effort will form the foundation for many of the other performance support areas. Their objectives are to: Help managers determine whether all responsibilities are covered and allocated correctly. Clarify the ownership of responsibilities. Help incumbent understand what is expected of them. Focus career development and performance appraisals. Define criteria for new job grades, wage and salary structure. Identify skills requirements. Guide productivity metrics. Determine needs for hiring, learning, and outplacement guidelines. Guide the organizational structure. Every target job will have an up-to-date job description.
Organizational structure/reorganization	Organizational structure, like work flows, seeks to optimize the organization of the new or changed work processes. In addition to the objectives described under work flows, reorganizations or adjustments in organizational structure may seek to: Reflect changes in job structure and competencies, time requirements, need for coordination, centralization/ decentralization of operations, and feedback time, as mandated by the new work processes. Provide more autonomy and reduce dependence on other departments/individuals for resources, etc. Provide individuals who must coordinate and cooperate with the physical proximity needed to do their job. Increase identification and quality control by localizing entire processes such that one group is responsible from start to finish. Eliminate inefficient redundancies. Reduce the number of jobs, thus length of process, to speed time to completion/time to market
Job Performance	

Performance Process	Objectives
Competency Models	Competency models seek to: Detail the knowledge, skills, aptitudes, and orientation required for job incumbents to be successful given the new or changed work processes. Indicate the behaviors and thought algorithms common to superior performers. Allow the interview and selection process to identify those individuals most likely to excel in the work, by focusing on past performance and behaviors in addition to experience and expertise.
Productivity metrics/productivity measurement system	Some of the possible objectives for productivity metrics are to: Encourage desired behaviors (what gets measured gets done) and/or demonstrate what is valued (what gets measured is perceived as important). Suggest trends and possible improvements while "in process," that is, operational control. Estimate future capability through the measurement of strategic investments (in people as well as in capital). Guide expectations for acceptable or exceptional performance, for possible use in performance reviews and the determination of rewards and recognition. Demonstrate and report achievement. Suggest areas that require attention (areas where productivity lags). Determine resource allocation, that is, how many FTEs (Full Time Equivalent) for each job.
Job Evaluation and Classification	
Job measurement/base pay	Some of the possible objectives for job measurement are to: Price jobs according to their relationship to strategic objectives for the technology-induced change effort, by developing new criteria that are in line with the objectives. Realign compensation to reflect the new responsibilities and competencies required of performers. Compete successfully in the job market for those candidates who fit the job requirements as dictated by the new or changed work processes and the objectives of the technology-induced change effort. Develop a job measurement process that encourages new values (for example points rating, which does not encourage individual competitiveness in the way that ranking does)
Classification/grade levels	Possible objectives for job classification/grade levels are similar to those of job measurement: Align classifications and grade levels with what is valued in the technology-induced change effort Encourage the acquisition and competencies that are in demand, through the systematization of rating or ranking factors that reflect the values of the change effort Dilute the bureaucratic or hierarchical configuration of the organization to promote fluidity and flexibility
Performance Support Practices, Tools and Systems	
Recruitment Selection Orientation Transfer	Recruitment, selection and orientation strive to: Reflect the job descriptions and competency models, in order to guide the staffing process in accordance with the values and objectives of the new technology implementation Identify the appropriate sources for potential employees In the case of orientation, inform employees of the organization's mission, vision, and strategic goals, as well as details of the performance support system.
Outplacement Termination	Although the aim of performance support is the development of job incumbents, performance support tools to ease termination and facilitate outplacement may also be made available. Attention is paid to the emotional needs of the performer, as well as assistance in the transition
Goal setting and action planning	Goal setting objectives may include: Communicate to employees the criteria by which their performance will be measured. Allow for the joint development of plans for achieving performance goals. Build employee commitment to the achievement of goals that are in line with the strategic objectives of the organization. Demonstrate to the employee the value of their job in contributing to the achievement of overall organizational goals. Recognize the employee's career goals and identify resources and opportunities available for furthering them

Performance Process	Objectives
Feedback	Feedback processes are key to performance management. They strive to: Provide the employee with information on how their performance is meeting, or missing, the target goals Allow the employees to adjust or strengthen performance in time to meet performance goals Provide feedback that is: ongoing, timely, frequent, reinforcing, objective, positive
Performance review	With ongoing feedback in place, performance reviews become opportunities to: Celebrate goals met Review lessons learned Plan the next performance cycle Discussion of bonuses, raises, and other financial aspects of the job are left to another occasion.
Career planning/employee development/transfer	Career planning strives to: Identify ways to help individuals understand corporate changes in career opportunities and job expectations. Identify key experiences important to firm and important to individual's career development. Evaluate managerial skills and functional knowledge in relation to emerging opportunities. Enhance self-confidence, willingness to take reasoned risks, and need for achievement Enhance problem-solving and relationship skills.
Raises and promotion	Objectives for raises and promotions can include: Base raises and promotions on performance, rather than the simple passage of time. Reward <i>how</i> results are achieved, as well as <i>if</i> results are achieved Promote the values of the organization given the objectives of the new technology implementation. (for example, if the raise pool is fixed, such that one person's above average raise means less for someone else, competitiveness may be enhanced at the expense of teamwork.)
Team celebrations	Celebrations that honor group achievements of desired objectives strive to: Celebrate group accomplishments in ways that are personally meaningful to the employees. Strengthen cooperation as well as commitment. Increase identification with the goals of the change effort.
Individual contributor awards	Individual contributor awards may have the following objectives: Highlight certain individual behaviors for possible emulation Enhance the sense of personal responsibility and contribution Reward individual contributions to team goals
Non-monetary awards	Non-monetary awards may seek to: Reward behavior and accomplishments in ways that are relevant to the employees. Provide rewards and recognition while maintaining cost-effectiveness of the incentives program. Enhance the market competitiveness of the position. Increase the perceived desirability of the organization to prospective employees. Reinforce the corporate culture.
Job-Person Matching	
Succession planning	Succession planning processes are optimally available for all levels of the organization. Succession planning is designed to: Develop individuals who possess the requisite skills to lead in the environment created by the technology-induced change effort. Minimize disruption to the strategic mission and vision during the change effort by providing individuals who are already "on board" and prepared to step into positions once they become vacant. Plan leadership resource strategies for the short and long term. Retain individuals with valuable experience while ensuring that they have the required cross-functional skills to succeed at higher levels. Realize the potential of especially promising new graduates.
Learning	Reskill users to meet the new demands that accompany the new technology implementation.
Job assignment	If there has been a skills assessment, performance support may include tools that map employees' skills and interests to the requirements of the jobs to: Identify which employees are most suited for which new jobs Align current and future resources in the most mutually beneficial ways, for example, ways that increase productivity and opportunities to succeed Identify jobs for which current employees need additional learning Determine best resourcing options for vacant jobs

Human Performance Support Systems Recommendations

Work Flows, Job Structure, and Organizational Structure

The following documents recommendations formulated for work flows, job structure and organizational structure:

Job Performance

The following documents recommendations formulated for job performance:

Job Evaluation and Classification

The following documents recommendations formulated for job evaluation and classification:

Performance Support Practices, Tools and Systems

The following documents recommendations formulated for performance support practices, tools and systems:

Job-Person Matching

The following documents recommendations formulated for job person matching:

Learning Plan

The recommendations for job-person matching include a learning plan per role. Consider the following when developing the learning plan:

- core and tools learning (follow Oracle master path with learner verification)
- Oracle Certification Program/Professional Development Paths
- application learning (through Oracle Education centers)
- non-Oracle technical learning
- Tutor (if supported by Information Technology) and connectivity
- applicable Computer Based Learning (see titles from NetG)
- procedural knowledge
- business skills

Human Performance Support Systems Effectiveness Measurement

To favor the effectiveness of the performance support processes deployed, we recommend the following measurement approach:

Measurement Approach	Recommended Approach
Performance support deployment scorecard criteria	
Performance support systems scorecard criteria	
List of measurement methods	
List of measurement deliverables	
List of measurement events	

Required Human Performance Support Systems Materials

In light of the above recommendations, the following materials will be required for the prioritized roles:

Roles	Required HPSS Materials

Human Resource Information System (HRIS) Implications

Each of the performance support process has implications on the human resource information system. When performance support processes have been defined, we will determine which processes link to the Human Resource Information System (HRIS) and to what end. We will then review the configuration to determine any recommendations for revisions to the system. At this point, we have identified the following:

- ...
-
-

User Support Requirements

The Need for User Support

User support is critical to the success of the implementation because:

- People are the organization's only sustainable, and truly renewable, competitive resource – ensuring that they are competent in their new roles and properly supported is the number one key ingredient to success.
- There are multiple potential points of failure – the more computers, networks, software, etc., the greater the changes that something will fail.
- There are varying levels of PC and software expertise within the user community – some users are “power users” while others will be novice, but all are expected to be productive on the same hardware and software platform at go-live.
- <Project Name> is a global implementation – localization to meet business, governmental, and cultural requirements adds a myriad of issues that impact consolidation into a common database structure that is viewable and usable across the organization
- The question becomes, “After the development teams are disbanded and the consultants are gone, how does <Project Name> maintain momentum, continue to focus on the business, end confirm that the system remains functional for the long run?”

The multi-vendor, multi-product environment of this project exacerbates these problems while adding a few of its own. There may be finger-pointing among vendors and too many vendors can potentially cause end users to waste many hours trying to answer questions like: “Whom do I call?” “What do they support?” “I’m not getting what I need?” “The feedback is not timely!”

When support is not easy to find or access, users often turn to one another for help, productivity is lowered because two or more workers are working to resolve the same issue. Also, peer support often complicates the approach because it is inadequate and sometimes promotes approaches that are not consistent with overall system goals. Such local work-arounds may have unanticipated consequences on the larger system or process. Additionally, locally developed solutions often do not find their way into an organization's knowledge base where others can find them.

Approach

The graphic below illustrates the user issues that need to be addressed. There are three distinct activities to support – Learning, Self-Help Tools and Help Desk Services.

This section addresses the strategy for Help Desk Services and Self-Help tools.

Defining Requirements

When defining the requirements for the technical support to provide users, consider the following:

- user demographics: locations, numbers, types of users, roles (what products they are using)
- levels of support, for example, service levels agreements
- hardware issues and documentation
- software issues and documentation: software back up process, recovery strategy
- help design, tools, procedures
- new user (new hires/new incumbents) skilling
- on line performance support (for example, expanded tutorial)
- required skills for help desk: business skills
- call volume projections
- measurement against service level agreements
- escalation process
- on line tools for system status and communication of system status
- technical alerts
- set up and security user account passwords

- version upgrade
- support of user learning environment
- language requirements
- assessment of current support infrastructure
- installation of hardware/software
- procurement of hardware/software
- maintenance of hardware/software, including upgrades
- desktop support
- whom to call for what
- communication of service level agreements and daily status reports

Location Information

The following is applicable to end user location. Location information is used to project help desk call volume and to develop a ramp-up plan for the help desk. The source for this data is the business manager who is familiar with the operations of the site.

Site Rollout Plan

Site rollout plan: This document includes site locations, dates for go-live at each site, and application modules that will be used at the site. If a site has a staged implementation, that is, one module or suite will go live before others at the site, then this information is also required.

Location Details

The following documents the location details, relevant to the formulation of user support requirements:

Module by Location

The following lists the module by location, relevant to the formulation of user support requirements:

User Profile by Location

The following captures information on users by location, relevant to the formulation of user support requirements:

Staffing Model

This section provides a model for the number and type of staff that <Company Long Name> will require for its help desk.

Type of Model

The model used for projecting staffing requirements is derived from a queuing model developed by the Help Desk Institute and published in a white paper called, "Staffing, Scheduling, and Workforce Planing." This model allows us to predict mean wait time based on the assumptions described below along with a projected level of staffing.

New Arrivals per Time Period

New arrivals per time period is one of the critical variables in the queuing model. This is the number of calls that enter the queue during a given time period, which is 1 hour for this document. This number is calculated by a model that uses as input the number of sites, work schedules at each of the sties, and go-live dates of the sites.

Mean Call Time

This is the amount of time that is required to resolve a call, on average. This is used to create a variable called mean number of clients serviced per time request.

Productive Time

For example, each help desk agent has approximately 1,585 hours (76%) of time to address customer issues, based on the following table:

Available Hours per Year	Holiday, Vacation, Sick Hours	Formal Skilling	Assigned Projects	Other Tasks	Total Off-Phone Time	Available Phone time
2,080 hours	200 hours	70 hours	80 hours	145 hours	495 hours	1,585 hours

Call Complexity

Some measure of call complexity is required. This is important because more complex calls cause the average length of the call to be longer. It also impacts the level of learning that is required of the help desk analyst. A more complex call requires a better skilled analyst.

Counter-intuitively, the more effective skilling an user receives increases the complexity of calls to the help desk. The reason for this is that the user needs less simple assistance if they are skilled. Learning increases the productivity of the user and the capability of the user to make use of the system functionality, which causes him/her to have more advanced questions.

Growth Rate of the Number of End Users

It is important to determine how many end users will be added each month or year. This will affect the number of calls the help desk receives. Use end user turnover as part of the formula for calculating the rate of growth for end users.

Turnover Rate of the Help Desk Staff

Turnover of help staff can be quite high. It is an important measure because it dictates how much budget and time will be required to keep the help desk staffed.

Desired Level of Service

One example of level of service is queuing time – the time from when a call enters the help desk queue to when it is answered by a help desk analyst.

Implementation Complexity

The following grid guides the determination of the level of complexity of the customer's migration to a new system. The categories are ranked in order of complexity (1 being least complex and 5 being most complex):

Type of Migration	Complexity
Upgrading Oracle database and/or tool version	1
Upgrading Oracle application versions	1
Relational database to Oracle	1
A fourth-generation language or CASE tool to Oracle tools	2
Client/server environment to web architecture using Oracle database and tools	3
Non-Oracle applications to Oracle applications - client/server to web	3
Non-Oracle applications to Oracle Applications - legacy to web	4
Internal Information Technology to Outsourced Information Technology	4
Legacy environment with custom apps to web architecture using Oracle database and tools for custom apps	5
Outsourced Information Technology to internal Information Technology with Oracle tools	5

Complexity Factors

Complexity factors include the following:

- Skills:
 - ◊ the existing skills suffice,
 - ◊ the existing skills require upgrading or
 - ◊ new skills are required
- Roles:
 - ◊ the existing roles support the migration; no changes required;
 - ◊ the existing roles support the migration but require redefining;
 - ◊ one or two new roles are required;
 - ◊ three or four new roles are required;
 - ◊ more than four new roles are required, there is significant change to most, if not all existing roles
- Organization
- Processes
- Architecture (software, hardware, communication, management)

- Impact on other organizations
- Time to implement

Work Flows, Job Structure and Organizational Structure

Job Descriptions

Job descriptions include the following information:

- Job title
- Purpose (objectives the job is designed to meet)
- Job summary (what distinguishes it from other jobs)
- Authority and accountability (reporting relationships)
- Primary and secondary responsibilities (ranked)
- Description of tasks
- Date of last revision

They also include such information as:

- Grade level
- Traits or attributes required of the job incumbent (educational level – minimum and preferred, experience, learning, skills, etc.)
- Union affiliation

Job Performance

Competency Models

Competency models show a hierarchy of competency information:

- Cluster
 - ◊ Competency 1
 - ◊ Competency 2

Competency are clustered by:

- Dictionary cluster (for example, achievement-related, power-related, cognitive, interpersonal (affiliation), self-management)
- Job task or responsibility (for example, budgeting)
- Logical sequence in time

Competency models also show:

- Job responsibility by competency matrix showing which competencies are needed to de each part of the job
- Algorithms

Productivity Metrics

Wilson describes the qualities of effective measures with the acronym PROACT:

Positive	Phrased positively (indicating progress) rather than negative (pointing out obstacles, failure)
Reliable	Consistently accurate and verifiable
Objective	Data are collected from multiple sources
Active	You must have to do something to achieve it; it cannot happen without effort
Controllable	Within influence of performer
Timebound	Should indicate acceptable timeframe for completion

Job Evaluation and Classification

Depending on the method chosen in the approved recommendations, the job evaluation process involves:

1. Determining the factors that are value-added give the objectives for the new technology implementation.
2. Devising ratings scales or levels that indicate the presence (and where appropriate degree of presence) of these factors.
3. Clustering positions into grade levels or rankings according to overall scores for the ratings and levels.
4. Pricing the grade levels.

Performance Support Practices, Procedures, Tools and Systems

Performance Review

Performance management materials consist of manager's guides, and performance review instruments. The performance review template might include a rating scale for the measures, list of objectives (with spaces to indicate rating and milestones when complete), list of competencies with ratings, summaries of key strengths and areas for improvement.

Recruitment, Selection and Orientation

An interview guide based on the critical incident interview used to identify competencies may support the hiring and selection process. The interview will explore past behaviors of candidates, based on the principle that the best predictor of future performance is past performance. Instruments for rating the candidates based on competencies indicated, as well as behaviors exhibited during the interview, also accompany the interview guide.

Other possible recruitment, selection, and orientation deliverables include:

- standards for ads
- template and procedures for job posting
- form communications to candidates
- procedures for offer letters
- pre-selection procedures and criteria
- interviewing procedures and guides
- procedures for resumes, solicited and unsolicited
- procedures for the use of recruiting agencies
- selection matrices
- interview logs
- orientation materials and resource list: 1st week, 1st month, 1st year
- hiring procedures
- tips on interviewing techniques, including legal do's and don'ts

Termination and Outplacement

Termination interview guides will cover the legal implications of the process, in addition to the leading practices for conducting the meeting. The checklist for termination includes the following considerations:

- reasons for termination

- documentation and performance appraisals
- content of communications to the employee
- severance benefits/arrangements (salary, health coverage, money stock purchase plans, etc.)
- outplacement options
- tips on interview techniques (sensitivity, unequivocal communication, listening, etc.)
- follow-up processes (letter, etc.)
- timing (not Friday, to allow for follow-up if needed; check for compliance with government regulation, for example, requiring xx days notice before closure of a plant or workplace, etc.)
- logistics (return of keys, removal of personal property, inventory badges, etc.)

Outplacement resources include lists of referrals to outside consultants or agencies the organization uses to assist in the outplacement process, skills and interest self-assessment instruments, resume writing and editing support, etc.

Rewards and Recognition Programs

Rewards and recognition deliverables include data sheets explaining how the programs work, guidelines for determining eligibility and payout, procedures, policies, certificate templates, etc.

Job-Person Matching

Job-person matching materials include:

- Mapping skills profiles to skills requirements
- Learning plan
- Succession planning procedures

Human Performance Support Systems Measurements

The general goal of customizing instruments for evaluating performance support effectiveness is to create materials that will effectively measure the performance support objectives, to determine the effectiveness of the performance support materials and approaches in meeting them, and to allow for revisions and recommendations for ongoing support.

Measures include:

-
-
-

Human Performance Support Systems Roll-Out Plan

The roll out requirements involve communication and learning events on how to use the tools developed for performance support, including initial goal setting and planning sessions, description of new job opportunities or duties, description of the performance management process, and clarification of criteria for performance measurement.

The following communication and learning events aimed at <relevant Human Resource personnel, managers/supervisors for the target job/role groups, end users and other stakeholders> need to take place:

Target	Content	Communication Events	Learning Events
Human Resource Personnel			
Managers/Supervisors			
Users			
Other:			

Human Performance Support Systems Learning Materials

The Human Performance Support Systems (HPSS) learning materials are intended for the managers who will be responsible for managing to the new performance expectations. They cover the new expectations per role, how each role fits in the new workflows, the new work management structures, and the tools that will now be used to manage performance within the new work context.

Open and Closed Issues for this Deliverable

Open Issues

ID	Issue	Resolution	Responsibility	Target Date	Impact Date

Closed Issues

ID	Issue	Resolution	Responsibility	Target Date	Impact Date

Appendix A - Location Information Spreadsheet Template

Appendix B - Sample Questions to Gather Human Performance Support Systems Data

Department Culture

The following questions were used to gather data on the department culture:

- Artifacts: What artifacts (symbols) are visible in the workplace?
- Slogans: What slogans are used in the workplace?
- Important aspects of the job: What is important about the job?
- Customer importance: What is important to you about the customer?
- Employees' view of importance: What do you believe is important to your colleagues?
- Managers' view of importance: What do you believe is important to your managers?
- Employees belief about management: How do employees perceive management's ability?
- Employees belief about the organization: What do employees believe about the organization?
- Employees belief about the job: What do employees believe about the job?
- Employees belief about quality: What do employees believe about quality?
- Employees belief about the customer: What do employees believe about the customer?

Work Environment

The following questions were used to gather data on the work environment:

- Barriers: What gets in the way of completing your job tasks?
- A good day: Describe a good day. What made it a good day?
- A bad day: Describe a bad day. What made it a bad day?
- Benefit of Job: What do you like about your job?
- Detriment to job: What do you dislike about your job?
- Ideal environment: Describe the ideal environment for your job.

Goals

The following questions were used to gather data on corporate goals:

- Team goals: What are your team goals?

- Personal goals: What are your personal goals?

Educational Requirements

The following questions were used to gather data on educational requirements:

- Educational background: What formal education/learning background does your job require?
- Prerequisite skills and knowledge: What prerequisite skills and knowledge does your job require? (for instance, special terminology, programming, typing, database - basic, intermediate, advanced levels)

Tasks

The following questions were used to gather data on tasks:

- Major job tasks: What are the major tasks for your job?
- Task sequence: Is there a required sequence for performing these tasks? If so, what is the sequence?
- Task ranking: On a scale of 1 to 6 (with 6 as the highest ranking), how critical is the task to the function of your job role?
- Number of people doing the task: Are there others who perform this same task within the department? If so, how many? Where are they located?

Operating Procedures

The following questions were used to gather data on operating procedures:

- Equipment: What equipment do you use for this task?
- Safety factors or security regulations: What safety factors or security regulations are required for this task?
- Performance standards: Is the performance of this task standard with all who perform it? If not, what is different?
- Consequences to the organization: What are the consequences to your customer and the organization if this task is done incorrectly? What are the consequences to your achievement of your goals?
- Permissible error rate: What amount of error is permissible?
- Approval limit: What is your approval limit for the task?
- Authority level: What is your authority level for the task?
- Task standards: What are the standards for the task? (that is, speed, accuracy, quantity)
- Most important standards: What standard(s) affect the task most?
- Recourse for recurring problems: When you notice a continual recurrence of a customer-related problem, what recourse do you have to respond, correct, or elevate the problem?

Task Occurrence

The following questions were used to gather data on task occurrence:

- Task frequency: How often per day, week or month do you perform this task?
- Task timing: How long does it take to perform this task?
- Stimulus for task: How do you know when to begin this task?
- Task completion: How do you know when the task is completed?
- Correct completion: How do you know if the task is completed correctly?
- Incorrect completion: How do you know if the task is completed incorrectly?

Task Feedback

The following questions were used to gather data on task feedback:

- Feedback sources: What feedback sources exist when performing this task?
- Reinforcement mechanism: Is there a reinforcement mechanism in place to encourage good performance? If so, what?

Task Learning

The following questions were used to gather data on task learning:

- Existing learning offerings: What learning do you receive to support you in performing your tasks?
- Suggested learning offerings: In your opinion, what should the learning content be for these tasks?
- Job aids: What job aids do you use for these tasks?

Task Inputs

The following questions were used to gather data on task input:

- Raw material for the task: What is the raw material for this task/subtask? (input)
- Provider of raw material: Who provides the raw material(s)?
- Standards for the raw material: What are the standards for the raw material?
- Frequency of provision of raw material: How often is this raw material provided?

Task Outputs

The following questions were used to gather data on task output:

- Task output: What is output of this task?

- Output standards: What are the standards for the output(s)?
- Output recipient: Who or what is the recipient of this output?
- Output frequency: How often does this happen?
- Output records: Do you keep records of the output? If so, in what form?

Degree of Change (Role)

The following questions were used to gather data on the degree of change to roles:

- New processes: What new work processes do you envision after implementation?
- Change resulting from Implementation: How will roles change after implementation?
- New roles: What new roles will be required after implementation?
- New performance measures: How do you see performance measures changing as a result of the implementation?

Appendix C - Organization's Policies and Procedures Impacted by Oracle Applications

The following is a sample listing of how the organization's policies and procedures might be impacted by Oracle Applications.

Topics	Groups	Description
Financials	Assets	Property and equipment inventory procedures, and tax accounting policies.
	Fin. Analyzer	Financial analyzer allows authorized users to access data, drill down and get results quickly.
	General Ledger	Provides multi-national, multi-currency bank reconciliation and cash management.
	Payables	Invoice and payment processing.
	Purchasing	Purchase order creation and management.
Manufacturing	Receivables	Handles multinational payment methods, recording of taxes, and issuing letters of credit.
	BOM	Generation and management of Bill of Material.
	Capacity	Manages manufacturing capacity planning.
	Cost Mgmt	Manages manufacturing and engineering costs including the impact of changes
	Engineering	Prototype and schedule implementation of new designs.
	Inventory	Inventory management.
	Product Config.	Ensures validity of product configurations.
	Purchasing	Manages procurement activities.
	Quality	Access to quality data. Root cause and analysis, and corrective action.
	SC Planning	Supply Chain Planning.
	Scheduling/MRP	Provides Materials Requirements Planning and scheduling.
	Supplier Sched.	Supplier scheduling.
	WIP	Manages production requirements.
Supply Chain Management	Inventory	Inventory management.
	MRP	Materials Requirements Planning.
	Order Entry	Sales order management.
	Payables	Invoice and payment processing.
	Planning	Supply chain planning.
	Product Config.	Ensures validity of product configurations.
	Purchasing	Manages procurement activities.
	Quality	Track and analyze product quality and it's impact on customers.
	Receivables	Manages payment methods, recording, and issuing letters of credit.
Market Management	Scheduling	Supplier scheduling
	Service	Post-sales service management.
	App Data Whse	Allows multi-dimensional analysis of critical business information.
	Apps for Web	Using the Web for expansion of markets.
	Fin. Analyzer	Allows authorized users to access data, drill down and get results quickly.
	Sales & Mktg	Management of marketing ROI and win/loss analysis.
Projects	Sales Comp.	Modeling and management of compensation and sales quotas with revenue plans.
	App Data Whse	Allows multi-dimensional analysis of critical business information.
	Billing	Accrual of revenue based on different projects, divisions, etc.
	Costing	Flexible cost control for individual projects.
Human Resources	Personal T&E	Manages the charge of employee time and expense to specific projects.
	HR	Management of recruitment, staffing, learning, compensation and planning.
	Learning Admin.	Maintenance of course design and scheduling, financial admin. of learning, employee career tracking and planning.
	Payroll	Payroll process with rules-based management.
Information Technology	Sales Comp	Planning and management of labor costs.
	Business Agents	Provides the ability to tailor agents for rapid response to specific, key business events.
	EDI Gateway	Connects customers, suppliers, and/or business partners into the business workflow.
	SmartClient	Automates selected transactions either via client/server architecture or the Web.
	Workflow	Monitors progress and status of critical path items.
