Introduction

The Conversion Test Plans outline the testing procedures for the unit, business object, and validation testing for the conversion. These procedures have been designed to be used as a worksheet for the tester to fill out while performing the testing tasks:

- The unit tests determine that each conversion program module is successfully completing the task as intended. For example, a unit test should test to verify that the download program module has extracted the expected number of records from the legacy system.
- The business object test verifies that the data that has been converted to the target application is accurate and functioning properly.
- Conversion validation testing tests that the converted legacy system data functions properly within the entire suite of installed Oracle target applications. The conversion validation test verifies that the data can complete the entire business cycle including posting to the general ledger.

Distribute the Data Conversion Test Plan to:

- developers who are most likely responsible for performing the unit testing of the conversion programs which they have written
- testers who are responsible for performing the conversion business and validation tests
- conversion team members
- client staff member who is responsible for signing off on the accuracy of the testing procedures
- overall project leader
- conversion team leader

Use the following criteria to ensure the quality of this deliverable:

- ☐ Does the deliverable clearly explain each testing process including directions to the tester?
- ☐ Is there a table in the template for each program and for each business object which is to be module tested?
- ☐ Have all data elements which are important for business testing been selected? As a rule, most required columns in Oracle should be tested in conversion business object testing. Also many of the standard Oracle reports should be run as a test of the data's ability to function in the new application. The users should help determine the important data elements which should be tested from the legacy system perspective.
- ☐ Have users input been gathered?
- ☐ Have the custom reports which need to be developed for business object and validation testing on both the legacy side and the Oracle side been identified?
- ☐ Have resources been identified to create any identified custom queries or reports?

- ☐ Have these testing procedures been reviewed with the client and the testers?
- ☐ Are there trained testers who know how to navigate through the Oracle Application to perform the business object and validation tests?

Century Date Compliance

In the past, two character date coding was an acceptable convention due to perceived costs associated with the additional disk and memory storage requirements of full four character date encoding. As the year 2000 approached, it became evident that a full four character coding scheme was more appropriate.

In the context of the Application Implementation Method (AIM), the convention Century Date or C/Date support rather than Year2000 or Y2K support is used. Coding for any future Century Date is now considered the modern business and technical convention.

Every applications implementation team needs to consider the impact of the century date on their implementation project. As part of the implementation effort, all customizations, legacy data conversions, and custom interfaces need to be reviewed for Century Date compliance.

Conversion Unit Test - <Business Object To Be Converted>

This section contains describes the conversion unit test and provides a record of the unit test results for the conversion programs for <Business Object To Be Converted>.

This conversion requires the unit testing of the following types of conversion programs:

Seq.	Purpose	Description
1	Download Program	Legacy system program to create ASCII file
2	Upload Program	Upload script to a predefined temporary interface table
3	Interface Table Creation Program	Interface script to create temporary information and update table
4	Translation Program	Translation of legacy data elements to Oracle column requirements
5	Interface/Validation Program	Development of scripts to load Oracle production tables and perform data validation

Sequence 1: Download Program

Sequence 2: Upload Program

Sequence 3: Interface Table Creation Program

Sequence 4: Translation Program

Sequence 5: Interface/Validation Program

Conversion Unit Test Plan and Results for <Business Object To Be Converted>

Seq.	Action/Test Type	Expected Results	Actual Results	Failure Resolution

Conversion Business Object Test - <Business Object To Be Converted>

This component provides a table to record the business object test plan. Each business object could have multiple tables for testing, depending on the number of data elements that are going to be tested and the number of target application tables populated by the business object in the Oracle target application.

The test procedure for the conversion business object test is as follows:

- 1.
- 2.
- 3.

Conversion Business Object Test Details

Business Object:

<Business Object To Be Converted>

Conversion Validation Test

This component provides a table to record the validation test plan. Following is an explanation of the validation test procedures:

- 1.
- 2.
- 3.

Conversion Validation Test Results

Target Application: <Target Application>

Business Object: <Business Object To Be Converted>

Tested by:

Date:

Test Method	<Legacy System> Record Totals (1)		<Target Application> Record Totals (2)		Variance	Explanation
	Initials		Initials			
Record Count						
Total Number of Records						
Records per Sales rep						

- (1) Performed as part of the pre-conversion steps
- (2) Performed as part of the post-conversion steps
